- Connection: The main line emanates from the manifold, branching off to various components.

2. Brake Booster

- Function: Amplifies driver?s braking force, reducing pedal effort.
- Connection: A large diameter hose connects directly from the intake manifold to the booster?s vacuum port.

3. EGR Valve and Vacuum Modulators

- Function: The EGR valve recirculates exhaust gases to reduce emissions; vacuum modulates

its operation.
- Connection: Lines run from the intake manifold to the EGR solenoid and then to the EGR valve.

4. HVAC Vacuum Actuators

- Function: Control air blend doors, mode doors, and temperature zones.
- Connection: Multiple lines branch from a vacuum distribution manifold to various actuators within the HVAC system.

5. Cruise Control Vacuum System

- Function: Uses vacuum to maintain vehicle speed.
- Connection: Lines connect from the intake manifold through a vacuum reservoir to the cruise control servo.

6. Vacuum Reservoir/Tank

- Function: Stores vacuum to ensure consistent operation during engine load changes.
- Placement: Usually mounted near the firewall or engine bay, connected via a dedicated line.

7. Vacuum Control Solenoids and Valves

- Function: Electrically controlled valves regulate vacuum to different components based on signals from the engine control module (ECM) or other modules.
- Connection: Lines run between the solenoids, vacuum lines, and target components like the EGR valve and HVAC actuators.

Step-by-Step Breakdown of the Vacuum Line Routing

Understanding the routing helps in troubleshooting and repairs. Here's an in-depth look:

Step 1: Main Vacuum Supply

- The primary line starts at the intake manifold?s vacuum port.
- It branches out to feed the brake booster, EGR system, and HVAC actuators.

Step 2: Connecting the Brake Booster

- A thick, durable hose runs from the intake manifold directly to the brake booster?s vacuum port.
- This line is critical; a leak here results in increased brake pedal effort.

Step 3: Routing to EGR and Emissions Components

- The vacuum line from the intake manifold feeds into a vacuum control solenoid.
- From this solenoid, lines run to the EGR valve and other emission-related components.
- The solenoid is electronically controlled, opening or closing vacuum pathways based on engine operating conditions.

Step 4: HVAC Actuator Lines

- Multiple smaller lines originate from a vacuum manifold or distribution block.
- They connect to mode doors, blend doors, and other HVAC components.
- Proper sealing and routing are essential to prevent air leaks that cause climate control malfunctions.

Step 5: Cruise Control System

- A dedicated vacuum line runs from the intake manifold to a reservoir.
- From the reservoir, another line connects to the cruise control servo, enabling it to maintain speed.

Step 6: Vacuum Reservoir Placement

- Typically mounted on the firewall or inside the engine bay.
- Acts as a buffer, ensuring steady vacuum supply during engine load fluctuations.

Step 7: Control Solenoids and Valves

- Electrically operated, these control the vacuum flow based on signals from the vehicle's control modules.
- They are usually mounted near the intake manifold or firewall with accessible wiring and

vacuum lines.

Interpreting the 1996 Cadillac DeVille Vacuum Line Diagram
